<https://cccc.charite.de>

At Charité Comprehensive Cancer Center, all types of cancer are treated in specialized centers.

## Molecular Genetic Consultation

Within the framework of the molecular genetic consultation at the Charité Comprehensive Cancer Center, cancer patients can receive advice on specific examination methods. By targeted testing of tumor tissue, changes in the genes of cancer cells can be detected or excluded, allowing for conclusions to be drawn about potential targets for drug-based tumor therapy.

## Immunotherapy and Personalized Medicine

Immunotherapy aims to enable the body's immune system to attack cancer cells. In close collaboration between physicians and scientists, various approaches are currently being researched to develop treatment strategies in the context of personalized medicine.

## Psycho-oncological Counseling

A cancer diagnosis often represents a significant psychological burden for patients and their loved ones. The psycho-oncological counseling services at the Charité Comprehensive Cancer Center therefore target both cancer patients and their relatives. We aim to support you in maintaining or regaining the highest possible quality of life and taking control of your life in the face of illness.

## Second Opinion

An expert second opinion provides the opportunity to seek additional advice on a cancer diagnosis or treatment from a team of specialists. By pooling oncological expertise, an optimal treatment plan can be decided upon in collaboration with the patient.
